Abstract

This packet Tracer project is an extension of a previous project tiled as "3-Tier Campus LAN Architecture with VLANs". In this project the goal was to allow automatic configuration of IP settings on the end hosts at the access layer instead of having to statically assign an IP address configuration on each end host added to the respective VLANs. The distribution switches in the Engineering building were successfully configured as DHCP relays for DHCP messages coming from the engineering and Computer Science VLANs. The distribution and access switches added in the administration building connected the standalone DHCP server to the rest of the network. DHCP messages from the server successfully reached the end hosts in the other building. Automatic IP configuration of all end hosts was achieved using DHCP.

Introduction

The aim is to implement Dynamic Host Configuration Protocol (DHCP) for end hosts in a 3-Tier campus LAN architecture, in Packet Tracer. The 3-Tier LAN contains 2 VLANs at the access layer. Port Security is already enabled at the access ports. This 3-Tier configuration was created in an initial project titled as "3-Tier Campus LAN Architecture with VLANs". Now the goal is to add an additional distribution and subsequent Access layer representing another part of the campus LAN network i.e., an additional geographical area/building hosting the standalone DHCP server. As part of this process, Hostnames will be configured on the new distribution and access layer network devices, new uplinks to the Core switches will be aggregated using the port aggregation protocol PAgP, IP subnets manually configured and routing will be implemented using OSPF, a DHCP relay will be configured, and finally ports will be secured using DHCP snooping and Dynamic ARP Inspection.

Verification & Discussion

A random switch and its corresponding end hosts were selected to demonstrate the functional configuration of DHCP on the 3-Tier LAN architecture. End Host CompSci-PC2 and Eng-PC4 seen in figure 5 and figure 6, respectively, are both connected to access switch, ACC-SW3. The end hosts can successfully release and automatically renew there IP configuration communicating with the DHCP server at IP 172.4.0.100 via VLAN 30, 31 default gateways 172.30.0.1 & 172.31.0.1. Distribution switches DIS-SW1 & DIS-SW2 contain the VLAN 30, 31 virtual interfaces and these layer 3 switches were configured as DHCP relays. The DHCP binding table in figure 7 provides further confirmation that DHCP is configured for each accessible VLAN at the Access layer.
